

Exercise 6: Renaming and Deleting a File

For this exercise, you will be creating a new file, adding it, renaming it, and then deleting it.

1. Open your text editor, create a new file, write a sentence, and then save it as **ex6.md** in your **exercise** folder.
2. Add the file, commit it, and push it. Verify that you can see it in GitHub.
3. Now rename it to **exercise6.md**. You can do this with the File Explorer (Windows) or Finder (Mac). Or you can use the command line:

```
mv ex6.md exercise6.md
```

4. Do a git status and notice that **ex6.md** is deleted and **exercise6.md** is added.
5. Add the current directory, commit, and push it. Verify that the new name is on GitHub.
6. Now delete the file. You can do this with the File Explorer (Windows) or Finder (Mac). Or you can use the command line:

```
rm exercise6.md
```

7. Add the current directory, commit, and push it. Verify that the file is no longer there on GitHub.
8. Click on the **commits** link so you can see your history of commits.
